Sequence 26, Application No. US20030044792A1

Fublication No. US20030044792A1

GENERAL INPORMATION:

APPLICANT Tang et al.

TITLE OF INVENTION: METHODS AND MATERIALS RELATING TO NOVEL STEM CELL GROWTH

TITLE OF INVENTION: PACTOR-LIKE POLYPEPTIDES AND POLYNUCLEOTIDES

FILER REFERENCE: 28110/37260A

CURRENT APPLICATION NUMBER: US/09/894,912A

CURRENT PILING DATE: 2002-05-10

PRIOR PILING DATE: 2001-04-05

PRIOR PILING DATE: 2001-04-05

PRIOR PILING DATE: 2000-06-28

PRIOR PILING DATE: 2000-06-65

furin (BC 3.4.21.75) - fall armyworm
NiAlternate names: paired basic amino acid cleaving enzyme; proprotein convertase; sering
Cispecies: Spodoptera frugiperda (fall armyworm)
Cispecies: Spodoptera frugiperda (fall armyworm)
Cispecies: Spodoptera frugiperda (fall armyworm)
Cispecies: Tail 1. Jan. 2000

Subtributed the proprotein convertage (EC 3.4.21.-) homolog - human
N.Alternate names: PC6A protease
C.Species: Homo sapiens (man)
C.Date: 11-Apr-1997 #sequence_revision 09-May-1997 #text_change 22-Jun-1999
C.Jacesion: JC6148
R.Miranda, L.; Wolf, J.; Pichuantes, S.; Duke, R.; Franzusoff, A.

Intestine, adrenals and lung but not in the brain.

-:- DEVELOPMENTAL STAGE: Weakly expressed throughout the embryo, except in the developing nervous system, the ribs and the liver, but markedly upregulated at discrete sites during development. At B6.5, prominent expression observed in differenciated decidua. At B7.5, intense expression in extraembryonic endoderm, amnion and nascent mesoderm. At B8.5, abundant expression in somites and yolk act followed by a confination to dermamyotome compartment. Between B9.5 and B11.5, abundant expression in ARR (thickened ectodermal cells of limb buds). At B12.5, expression in the limbs is confined to the condeminal mesoner was earliage of At this
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This SWISS-PROT entry is copyright. I "Bvolution of the protormone convertases: identification of a non-logue of PC6 in the protochordate amphioxus.";
D isochim. Biophys. Acta 1477:338-348(2000)
C --- FUNCTION: Likely to represent a widespread endoprotease activity within the constitutive and requiated secretory pathway. Capable of cleavage at the RX(K/R)R consensus motif (By similarity).
C --- CATALYITY: Release of mature proteins from their proproteins by cleavage of Axy-Xaa-Yaa-ARC-|-Zaa bonds, where Xaa can be any amino acid and Yaa is Axg or Lys.
C --- SUBCELLIULAR LOCATION: ISOPORM A AND ISOPORM C ARE SECRETED.
C --- ALTERNATIVE PRODUCTS:

TISSUS SPECIFICITY: Bach PACE4 isoform exhibits a unique restricted distribution. PACE4A-1 is expressed in heart, brain, placenta, lung, skeletal muscle, kidney, pancreas, but at comparatively higher levels in the liver. PACE4A-II is at least expressed in placenta. PACE4B was only found in the embryonic kidney cell line from which it was isolated. PACE4C and PACE4D are expressed in placenta. PACE4E-I is expressed in cerebellum, placenta and pituitary. PACE4E-II is at least present in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    IsoId=P29122-6; Sequence=VSP_005427, VSP_005434, VSP_005435; Note=Probably enzymatically Inactive;

proproteins by cleavage of Arg-Xaa-Yaa-ARG-|-Zaa bonds, where Xaa can be any amino acid and Yaa is Arg or Lys.
SUBCELULAR LOCATION: PC5A IS SECRETED THROUGH THE REGULATED SECRETORY PATHWAY. PC5B IS A TYPE I MEMBRANE PROTEIN LOCALIZED TO A PARANUCLEAR POST-GOLGI NETWORK COMPARTMENT IN COMMUNICATION WITH EARLY ENDOSOMES (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    kydney primordia.
DOMAIN: The propeptide domain acts as an intramolecular chaperone
assisting the folding of the zymogen within the endoplasmic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     -!- DOWAIN: AC 1 and AC 2 (clusters of acidic amino acids) contain sorting information. AC 1 directs TGN localization and interacts with the TGN sorting protein PAGS-1.
-!- SIMILARITY: Belongs to peptidase family S8.
-!- SIMILARITY: Contains 1 homo B/P domain.

Note=No experimental confirmation available;
Note=No experimental confirmation available;
TISSUB SPECIFICITY: In larvae and adults, expressed in all
hypodermal cells, vulva and ventral nerve cords.
DBVELOPMENTAL STAGE: Expression starts at embryo two-fold stage
through to adults.
SIMILARITY: Belongs to peptidase family S8. Furin subfamily.
CAUTION: Ref.1 sequence differs from that shown due to a
frameshift in postion 651.
CAUTION: Ref.2 (AAB96754 and AAB96757) sequence differs from that
shown due to erroneous gene model prediction.

for proprotein convertase function in C. elegans.";
Gene 252:15-25(2000).
-!- FUNCTION: The Kex2/subtilisin-like proteinase activity of this enzyme is required for the normal production of adult cuticle.
There is functional redundancy between the isoforms. Vital for embryonic and larval development.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ENDOPROTEASE BLI-4.

Juliary and regulated by thyroid status.";

Ridocrinology 135:1178-1185(1994).

-! FUNCTION: Likely to represent an endoprotease activity within the constitutive secretory pathway, with unique restricted distribution in both neuroendocrine and non-neuroendocrine tissues and capable of cleavage at the RKIK/RNR consensus motif.

-! CATALTITE ACTIVITY: Release of mature proteins from their proproteins by cleavage of Arg-Xaa-Yaa-ARG-|-Zaa bonds, where Xaa can be any amino acid and Yaa is Arg or Lys.
                                                                                                                                                                                                                                               COPACTOR: Calcium (Potential).
TISSUE SPECIFICITY: High expression in the anterior pituitary and in several brain regions, the atrium, and the ventricle.
DOMAIN: The propeptide domain acts as an intramolecular chaperone assisting the folding of the zymogen within the endoplasmic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PAIRED BASIC AMINO ACID CLEAVING ENZYME

Comp. Neurol. 436:167-181 (2001).

-!- FUNCTION: Functions as a receptor for membrane-bound ligands
Jaggedl, Jagged2 and Deltal to requlate cell-fate determination.
Upon ligand activation through the released notch intracellular domain (NICD) it forms a transcriptional activator complex with RBP-J kappa and activates genes of the enhancer of split locus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             MEDLINE=21331789; PubMed=11438922;

WILLAR A.F., Kurban R.R., Hovens C.M., Ralph S.J.;

WILLAR A.F., Kurban R.R., Hovens Chain reaction to cloning members of the protein tyrosine kinase family.";

of the protein tyrosine kinase family.";

C.I. PUNCTION: THIS RECEPTOR BINDS INSULIN-LIKE GROWTH FACTOR I (IGF I)

TYROSINE-FROTENIX TANASE ACTIVITY.

C.I. CHALYTIC ACTIVITY: AND IGF II WITH A LOWER AFFINITY. IT HAS A TROSINE PROPERING FOR THE PROPERING CO.T. CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein tyrosine phosphate.

C. SUBUNITY: TETRARREN OF 2 ALPHA AND 2 BETA CHAINS LINKED BY DISULPIDE BONDS. THE ALPHA CHAINS CONTRIBUTE TO THE FORMATION OF THE LIGAND-BINDING DOWAIN, WHILE THE BETA CHAIN CARRIES THE KINASE DOWAIN.

C. SUBCELLULAR LOCATION: Type I membrane protein.

C. SUBCELLULAR LOCATION: Type I membrane protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This SWISS-PROT entry is copyright. "Open ligand activation through the released notch intracellular domain (NICD) it forms a transcriptional activator complex with RBP-J kappa and activates genes of the enhancer of split locus.

Affects the implementation of differentiation, proliferation and apoptotic programs (By similarity). May play an essential role in postimplantation development, probably in some aspect of cell specification and/or differentiation.

"I submunt: Heterodimer of a Cterminal fragment N(TM) and a N-terminal fragment N(BC) which are probably linked by disulfide

the postnatal ependymal cells, and the choroid plexus throughout embryonic and postnatal development.

TWIS Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furin-like convertase in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a C-terminal fragment N(TM) and a N-terminal fragment N(BC). Following ligand binding, it is cleaved by TNP-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called notch extracellular truncation (NEXT). This fragment is then cleaved by presentlin dependent gamma-secretase to release a notch-derived peptide containing the intracellular domain (NICD)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       NEUROGENIC LOCUS NOTCH HOMOLOG PROTEIN

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              EXTRACELLULAR (POTENTIAL)
                                                                                                                                                                                                                               from the membrane.
--- PTM: Phosphorylated.
--- SIMILARITY: Belongs to the NOTCH family.
--- SIMILARITY: Contains 35 BGP-like domains.
--- SIMILARITY: Contains 2 Lin/Notch repeats.
--- SIMILARITY: Contains 6 ANK repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         POTENTIAL
